

FULL-COLOUR DESIGNS

PRINTED GLASS

The printed glass offers designers a wide range of possibilities. It improves functionality and aesthetics. It stimulates creativity with drawings, patterns and colours, generating unique solutions which maintain the ability to control solar transmission.

Services: It decreases the entry of light and solar energy too and thus reduces the solar factor (g). Additionally, it increases privacy and can be incorporated into a laminated or insulated glass.

➤ Types

Screen printing. Ideal for vectoral designs. There is also the possibility of making them opacified.

Roller printing. Applicable to achieve an opacified glass with a 100% of coverage.

Digital printing. It is the perfect solution for the reproduction of images.

➤ Product range

Side One. Designed to place the design on the outside face of the glazing, capable of resisting the inclement weather.

Dual frit. Achieve the overlap of two points, one with the desired colour and the other one always in black.

Anti-slip screen printing. It can be used both indoors and outdoors.

➤ Safety

To ensure an efficient fusion between the enamel and the glass surface, it must be heat treated, whether be it tempered or heat-strengthened.

If tempered, it will confer it the maximum safety category according to EN 12600 of 1(C)1. For a surface area of less than 50% and of 1(C)3, for a larger surface area.
